## EXCAVATIONS AT REYNOLDS TAVERN

An Interim Report

FIRST DRAFT Susan M. Mira 20 June, 1983

On June 7th of 1982 archaeological excavations were commenced at Reynolds Tavern (AN- ), a mid-18th Century site located on 4 Church Circle in Annapolis, Maryland between Franklin and West Streets. Excavations for the summer were completed on August 1, 1982. In addition to the project directors, Dr. Anne Yentsch, now of the College of William and Mary and Dr. Mark P. Leone of the University of Maryland and field director Connie Crosby from the University of California, Berkeley, three supervisors alternated responsibilities at the tavern: Susan Mira, University of Pennsylvania; Annie Mullins and James Sorensen, American University. Crew sizes ranged from three to 15 people, most of the crew being students from the University of Maryland. In addition to the students, the tavern excavations involved ten volunteers, most of whom were from the Annapolis area. These volunteers attended at least once a week, often twice, and kept the field school hours (7:30 a.m. - 2:30 p.mr). The major sources of funding for the project came from Historic Annapolis Inc., the University of Maryland, the Maryland Committee for the Humanities and the Maryland Commission for the Capital City. The Reynolds Tavern property is presently owned by the National Trust for Historic Preservation and includes two 18th Century standing structures: the restored 22 story Georgian tavern, purported to have been first built in or soon after 1747, and a single room, brickfloor smokehouse which may be contemporary with or later than the tavern.

A major part of the tavern laboratory work was performed at two locations in Annapolis: a) inside a small 20th Century storage building adjacent to the smokehouse at the Reynolds Tavern site and b) on the second floor of 77 Main Street (Victualling Warehouse), a second archaeological site of the Historic Annapolis Project. The lab work was primarily under the direction of Cassandra Richards from the College of William and Mary. All cleaning and some

artifacts were then brought to the College of William and Mary. Cata
a Conservation

loguing was completed at the College of William and Mary by Cassandra

during 1982.83 The artifacts were returned to

Richards late fall of 1982. Further analysis of the artifacts re
Historic Amaphia during sprangl 1983 & presently await labelling

mains to be done.

Value of Maryland passaned before firth, auch hand work is und follow.

The site area consists of the yard behind or to the west of the tavern

building and a small bit of land away from the yard area, immediately north of the smokehouse and 20th Century storage building. This small bit of land, approximately 5' x 30', borders a parking lot that belongs to the Farmers'Bank of Maryland. Later in the field season a depressed area of the lot was broken and partially excavated. It is approximately 15 feet north of the smokehouse. The site proper is partly enclosed by an iron fence. The eastern boundary is the tavern building. The western boundary is the smokehouse and a chained area which separates a driveway to the 20th Century storage building from Franklin Street. There are two entrances to the site proper: a) a gate on Franklin Street and b) the chained entrance between the driveway and the yard. The site proper is approximately 45' east-west and 60' north-south.

Including the land away from the site proper, the site covers approximately 2,850 square feet. Of this, 1200 square feet or 42% of the site tested or has been excavated to some degree.

There were two kinds of ground cover on the site, short grass, and god Consult.

gravel, There is one large magnolia tree approximately 15 feat west of the NW corner of the 1906 addition of the tavern building. A 20th Century brick walkway, which ran westerly from the SW corner of the 1906 addition, was removed during excavation. This walkway was five feet wide and 45' long. The site slopes downward about 10' in a southwest direction.

but development to a but historic um by Paul Pearson

The tavern building and yard is not in use. There are plans, however, at the Ste in Schedule in 1983-84 for re-establishing the tavern. The primary interest of the excavators was in the development and use of the site during the 18th Century.

In brief, excavations revealed six features and a broad range of artifacts, primarily ceramics, bone and glass. Features included two 18th Century trash pits, an 18th Century cobblestone path, 19th-20th Century (?) structural material (slab, semi-circular brick wall and a small cobblestone flagstone floor), structural debris, and an oval well shall (possibly o costan).

The 18th Century cobble path ran west of the tavern and curved in a northerly direction, as is suggested by the slight bend before and behind or north of the smokehouse. It is this path that raises the question of the date of the smokehouse. The well (?) was briefly excavated in an afternoon at the end of the field season. The function or association of the structural material and debris is unknown.

This preliminary report on the excavations at the Reynolds Tavern is divided into 7 sections: the introduction, previous archaeological investigations, objectives, methods, historical background, a discussion of material remains (including features), and finally, conclusions.

Two appendices end the report, the first being summaries of each square excavated, the second being comprised of maps.

#### PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

In the summer of 1978 archaeological investigations were carried out to the at Reynolds Tavern by consulting archaeologists Kenneth G. Orr, Ph.D. and Ronald G. Orr, B.A. Their efforts were supported by Historic Annapolis, Inc.

The objectives outlined in their report included the definition of structural evidence in the front of the tavern (windows, entrances, old pavements, etc.), the definition of the cellar entrance to the tavern from Franklin Street, and the excavation of test pits in the tavern yard to assess the need for further excavation. Most of their work was done in front of the tavern building.

The three tests done in the backyard revealed a cobblestone feature, a midden consisting of 18th and 19th Century debris from the house, a relatively (19th Century?) recent brick "smokehouse" and an occupation zone indicating extensive activity over time (1978:26). They recommended that an intensive archaeological work be done in the yard. They found that the tavern had been built on a sloping hill, both E-W and N-S, on a grade of 10-15 degrees. The investigators also stated that the tavern served as a "stocking shop and livery stable". In (Bake, 19) addition, archival data indicated the presence of a stable and servants quarters on the Reynolds property.

#### **OBJECTIVES**

One intent of the Historic Annapolis Project at Reynolds Tavern was to conduct archaeological excavations to recover the remains of outbuildings, trash pits, privy holes, etc. in the yard area between and around the tavern and smokehouse. These excavations were also to provide the opportunity for students and volunteers to learn basic methods of excavation, mapping, data recording procedures and laboratory analysis.

Long term objectives include: a) determining the date; of the tavern and smokehouse as suggested by artifact analysis; b) determining the function and foodways of the tavern as suggested by artifact analysis; c) determining the date and function of all features uncovered; d) determining the development and overall use of the site since its inception; e) determining the function of the tavern with reference to the overall development of the City of Annapolis. Lastly, excavations were to prevent any loss of information and damage to remains through construction

Who was

which will take place at the site as\*part of the plans of Historic

Annapolis, Inc. in developing presentations of local history to the public.

#### FIELD METHODS

During the course of eight weeks 48 5' x 5' squares were excavated in the tavern yard. These squares were based on a grid with datum 15' east of the SE corner of the original tavern building (near the gate entrance into the yard from Franklin Street). Vertical control was based on the highest point per square. Only the English system of measurement was used for this excavation. The first five squares were selected at random. Thereafter, the site was partly divided into a checker-board of squares so that recording and recovering could be accurately accomplished. Sixteen other areas (five of which were trenches) were also excavated and varied in size from 2.5' x 2.5' to 2.5' x 5' or beyond 5' x 5', depending on interference and/or objectives to be met.

Each square was assigned a letter. Once the alphabet had been used, double letters were assigned. Letters I, L, O, and V were not used to avoid confusion with other numbers and/or letters. In addition to the letters, each square was assigned its grid number based on the site datum.

Most of the squares had the topsoil removed by shovel; thereafter, excavators troweled and sifted in 1/4" screens. There were exceptions to this procedure, e.g., shovel-shaving to find a feature.

Each square was excavated using natural stratigraphy. The Harris Matrix System (Harris:1979) was employed for keeping control of the stratigraphical record at Reynolds Tavern. The system is ideal for sites have which are excavated using natural stratigraphy and, thus, was suitable for the excavations in the Reynolds Tavern yard.

The Harris system requires that a single series of numbers (known as unit of stratification numbers) be used per site to identify every possible phenomena (not including artifacts) in the ground; namely, the

natural stratum, the man-made layer, the upstanding stratum (feature), the horizontal feature interface, and the vertical feature interface. Numbers were assigned when new stratigraphy occurred, i.e., starting from the latest units and working downwards to the earlier units of stratification. As each stratigraphic layer was numbered, it was defined (see square summaries). The definitions given to layers uncovered at Reynolds Tavern were based on soil composition and color and were assigned by one individual.

Recording of each stratigraphic layer not only involved the written definition of a unit of stratification but the drawing of plans and profiles (see figures A + B). The single layer plan was employed at Reynolds Tavern because of the complexity of the overlapping deposits. Some composite plans were drawn, especially in squares containing features. Not discussed by Harris as a fourth method of recording, but one which was regularly employed at the tavern site was photography.

As can bee seen in figure A and B plans and profile sheets designed for the tavern site had vertical and horizontal plus marks, the distance between which equals 6 inches. These grids were designed for the excavation of a 5' x 5' square. Larger graph sheets were used for drawings which covered greater areas. A solid line, known as boundary contour, was drawn to identify the unit of stratification in question. A dashed line was drawn to identify the interface of disturbance of an upstanding stratum.

The written description combined with plan and profile serves as the primary record for the tavern and ensures that every unit of stratification has been recorded to a basic level consistent with modern stratigraphic principles.

From this basic record, stratigraphic sequences were constructed (See figure C). These sequences are abstract drawings showing the relative vertical placement of all the units of stratification in a square. In urban settings, such as that of Reynolds Tavern, sequences are complex. These stratigraphic sequences will be combined with the artifact analysis in order to divide the units of stratification into phases or periods of occupation. In the final stage the abstract relationships of stratigraphic sequences will be turned back into positive evidence of the development of the tavern site.

Transit mapping was performed by Fernando Sanchez of Cornell University. These maps are in their final stages of development.

Architectural materials such as brick, stone, mortar, plaster, wood, chareoal, concrete, etc. were not collected, but their location was carefully noted. All other artifacts, e.g. ceramics, bone, nail, were systematically collected and bagged. New artifact bags were started each day. Bag labels included date, excavators initials, square letter, depth, and unit of stratification number. After washing, artifacts were tagged or labeled with site number, bag number and stratum number.

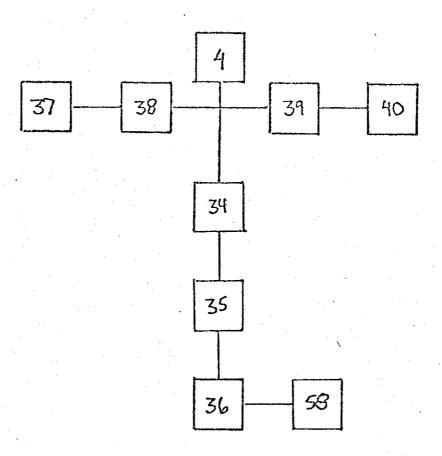

Auger tests were taken of areas not excavated to note any major changes in stratigraphy and/or detect the existence of features. (See Appendix II)

HISTORICAL BACKGROUND

Reynolds Tavern was one among several taverns located on West Street and Church Circle in the 1750's. West Street was of particular importance in the mid 18th Century because it led to the city gates of Annapolis, the only land entrance into the city. In addition to the tavern keepers, several luxury craftsmen were located on West Street and Church Circle in the 1750's.

Historic Annapolis Project
Reynolds Tavern
Square E

The following is an abstract indicating the relative placement of the units of stratification for Square E.

In September of 1747, St. Anne's Parish leased to William Reynolds for 63 years, lots 60 and 61 as indicated on the Stoddart survey of 1718. Reynolds subsequently built a tavern on lot 60. Before the leasing of the lots, William Reynolds, who had been trained as a hatter, kept a shop in Annapolis where he sold "sundry european and India goods," spices, confections, spirits, and other miscellaneous merchandise (James, 1975:3). In 1747, however, Reynolds was mentioned in the Maryland Gazette (James, 1975:3) as a hatter, and in later advertisement he appeared as a public housekeeper and hatter.

The tavern was short-lived. Reynolds advertised in the <u>Maryland</u>

<u>Gazette</u> of 1768 that he wished to give more attention to his hatmaking business than tavern keeping, but did not provide an explanation (James, 1975:4). Suffice it to say that the tavern had, at one point, a dual function: to cater to small planters by serving meals and drink and contain a hat shop.

The two lots bought by Reynolds included part of Dean Street, which then ran parallel to Franklin Street and ended at Church Circle.

The only map indicating the existence of Dean Street is the 1718 survey by Stoddart. It is thus felt that Dean Street disappeared as a result of particular use, or lack thereof, by Reynolds. In addition, it has been suggested by the documents that stables and a dairy were built on the property, the former probably on Dean Street.

When Reynolds died in 1777 the property went to his second wife,

Mary, and then to his daughter and son-in-law in 1783 (James 1975:5). The

tavern then became a boarding house. The property was soon sold to a

John Davidson (Collector of the Port) and in 1794 was occupied by his

wife Eleanor. In 1812 the property was sold to the Farmers Bank of

(www. in and was cadition)

Maryland. The tavern building then served to house the chief cashier of

the bank.

The bank extended the tavern in 1906 by adding a 2½ story wing on the back or west side. In 1936 it was bought by the Annapolis Public Library Association and used as a library until 1965, as conditions had become overcrowded (James 1975:6). In 1974 the Association deeded the building to the National Trust for Historic Preservation.

Since its beginning in 1747, the tavern building and the lot on which it stands have gone through several kinds of occupation. The uses of the tavern building from 1747 up to 1812 coincide with the general economic history of Annapolis.

Between 1715 and 1763 Annapolis experienced significant industrial expansion, but more importantly, bureaucratic growth. By the 1750's the bureaucracy was well developed and extracting a considerable income (Papenfuse 1977:12). Between 1715 and 1740 the permanent population of Annapolis doubled. There was an increase in opportunity as a result of the growing import market and related clientele. In addition, the change in the role of the London tobacco merchant in handling Maryland's import and export trade brought prosperity. It was in this setting that Reynolds built his tavern. Reynolds was not alone, however, in his venture. He may have sold the tavern in 1768 because competition from other tavern keepers was too much to deal with successfully.

Annapolis experienced a depression 1772 and 1773. Glasgow and London merchants were competing for colonial tobacco, and the prices paid increased significantly. These Europeans drew bills of exchange and credit was advanced to them on the assumption that the sale of tobacco in Glasgow or London would cover the amount drawn with interest (Papenfuse, 1977:61). Merchants were not able to pay bills and money became constricted. Just at recovery however, the Nonimportation Act of 1774 was created by resisting colonists. The Revolution transformed

the town from a center of wealthy consumers and their suppliers into an armed camp and distribution center for the war effort. William Reynolds died during this transformation in 1777 and the property went to his second wife Mary. What became of the hat shop is not known. The military presence in Annapolis placed severe strains on the residents as they struggled to feed, clothe, nurse and house its visitors. Though not documented, widow Mary Reynolds may have obliged to accomodate these men. In 1783 the Reynolds property went to his daughter and son-in-law and was used as a boarding house (James 1975:5). It was in that same year that Annapolis stopped its efforts for the war.

In the 1780's the government continued to be the mainstay of the community. Businesses derived much of their income from government employees and people who came to town for court days and the sitting of the General Assembly. In 1783, gentlemen planters, lawyers, and merchants controlled 49% of the assessed wealth of the town held by residents. The planters, however, were also merchants or professionals. Of six economic brackets compiled by Dr. E. Papenfuse (1977:139) in his book, In Pursuit of Profit, boarding house, tavern, and innkeepers were in the bracket with an income of 3 to 4 lbs taxable wealth in that year. Some of the tavern owners were widows; as Reynold's property was sold in that year, it is hard to tell whether it was his wife Mary or his son-in-law who was assessed. Papenfuse also noted that most innkeepers did not come from socially prominent families and that no great fortune was made through innkeeping.

In the 1790's Annapolis had a second depression of several years' duration in the tobacco trade. The growth of other urban centers, such as Baltimore, caused the diversion of capital. During this time Reynolds' property was sold to John Davidson, Collector of the Port, and in 1794 was occupied by his wife Eleanor. It is not known whether the property continued to function as a boarding house. During the depression,

owners of property were having difficulty leasing. After 1790 even the most prosperous ordinary keepers were not able to cope with the shrinking number of patrons. In 1793 fundamental changes in Maryland's economy took place...the London middlem an in the Chesapeake retail import trade was removed. In addition, fundamental changes had taken place in the agriculture of Tidewater Maryland. Specifically, crop diversification encouraged by wartime demands for wheat to feed the army and the later difficulties of shipping tobacco to its European market. What arose in 1805 was a Farmer's Bank that dealt with interestbearing private accounts and the ability to make loans available to property holders on a demand basis through "cash accounts" (like guaranteed checking accounts). The chartering of the Farmer's Bank was the logical outcome of settled affairs in the consignment tobacco trade. Here is one instance when the changing Annapolis economy directly affected old Reynolds' property. In 1812 the remaining portion of the original Reynolds' property was sold to the Farmer's Bank of Maryland. The bank constructed a branch building adjacent to the tavern and is there The tavern building served to house the chief cahsier of the bank for several years. The tavern was extended in 1906 through the addition of a  $2\frac{1}{2}$  story wing on the back or, more specifically, west side.

In the early 18th Century Annnapolis experienced fast growth demographically and economically...affording of the affluent. William Reynolds, like others, sought to capitalize through a business with two functions. Thus, the tavern/hat shop was built. Renolds died in the beginning of the Revolutionary War and his wife Mary lived in the tavern building and, possibly, used the building to house militia. After the war, Annapolis transformed into a market town. In 1783, Reynolds' son-in-law, then owner of the tavern, attempted to formalize business by instituting a boarding

## Abbreviation Guide

Most of the source citations should be self-explanatory. The greater share are Anne Arundel County deeds for which only the liber (book) letters and numbers (with page references) are given. For example NH 2:63 means Anne Arundel County deeds liber NH 2 page 63.

Because the summaries were done over a number of months, abbreviations are not always consistent and at times are cryptic. The following list attempts to correct the inconsistencies and make the more abbreviated references comprehensible. Unless otherwise noted all records are in the Hall of Records, Annapolis.

house. Income from the boarding house, however, was probably modest. In the 1790's a severe depression hit Annapolis from the tobacco trade and during that time the tavern was sold to the Collector of the Port. In the next few years the changing economy encouraged crop diversification and a charter for the first Farmer's Bank which was drawn in 1805. In 1812 the tavern building was sold to the Farmer's Bank. Though known as Reynolds' Tavern, the structure served as a tavern for only 21 years.

#### THE ARCHAEOLOGY

#### 20th Century Disturbance

Three modern utility trenches were located during excavations and intersect the yard of the tavern at different angles. One is a probable electric line running compass N-S and meeting the NW corner of the 1906 addition of the tavern, cutting across the yard to meet a telephone poll on Franklin St. The second is a sewage pipe which connects with plumbing at the SE corner of the 20th Century storage house adjacent to the smokehouse and intersects the yard in a E-W direction. The third trench is an electric line running E-W from a unit on the north wall of the 1906 addition to the tavern, to the center of the east wall of the smokehouse.

#### Stratigraphy

The tavern yard was characterized by differing sequences of strati-graphy. Though not based on transited elevations, it appeared that the peak of the 10-15; slope was at Church Circle and moved downward in both an eastern and southern direction. Note map in Appendix II for location of squares.

Squares E,H,T,U,NN (cobblestone walkway feature):

The ground cover for this area was a brown soil with a grass and weed

Mary Japan

news patriet

The first layer to occur was a chocolate and/or medium brown fill dark 2 mix. with brick and oyster bits (2-6" down beneath the surface). Red brown soil occurred at the same depth in square H near the builder's trench against the smokehouse wall. Following the fill and/or red brown soil was a dense layer of oyster shell with some brick fragments (7" DBS). Beneath this layer was the cobblestone (8-9") feature. Where the cobblestone did not occur there appeared a medium brown soil with oyster shell fragments. Small sand lenses (often sand lense squares) occurred inbefills and were usually a yellow brown. A small quadrant was excavated within "U" to note stratigraphy beside but beneath the cobble. The layer to follow the oyster and medium brown soil was a medium brown fill, followed by a red and yellow sandy soil, ending in the red brown soil which became sterile at 24" DBS. NOTE: A modern utility trench intersected squares T and U.

Squares G,R,X,XX,UU,CC (mortar feature):

The ground cover for "G" was gravel, which wer placed in the southern section of the yard when the tavern served as a library. The ground cover for the remaining squares was sand and part of the brick walk, also the result of landscaping when the tavern building served as a library.

These squares are of particular importance because they exhibit a transition in stratigraphy from south to north, moving with the slope. Squares G and XX began with dark brown fill from 1-7" DBS, then moved into a red brown fill with brick and cyster bits 8-12" DBS, followed by some mortar 12" DBS. This layer was, in turn, followed by a deep section of red brown soil which became sterile at 24" DBS. Squares R, UU and CC also began with a dark brown fill (1-6" DBS) but before moving into red brown fill, a layer of cyster shell with medium brown soil occurred at 7-8" DBS, then the red-brown fill from 8-12" DBS. Mortar appeared at 12" DBS. Square X which

A

By the stand

apparently moved from a brown fill 1-7" DBS to an oyster shell layer with medium brown soil 8" DBS into mortar at 11" DBS. Square R appeared to link X and G, the former showing more relationship with the cobblestone area than either G or R. NOTE: a utility trench intersected G and R; a sewage pipe intersected square X.

Squares Y,C,M (within gravel area near fence line on Franklin Street):

The ground cover for Y, C and M was gravel. Square Y had only two soil types, a medium brown fill (1-12" DBS) followed by a red brown soild which became sterile at 24" DBS. Square C, on the other hand, had its fill (1-12" DBS) and red brown soil (18" DBS) separated by a layer of dense oyster shell with a transitioned brown-oyster fill immediately above and below the oyster.

Squares A,B,RR,EE,FF,JJ,MM (closest to the 1906 addition to the tavern):

The ground cover for all squares was a brown soil with a weed and grass mix. Square A began with a dark brown fill (1-3" DBS) which, in the southern half of the square, was followed by a gold brown clay (3-6" DBS). Beneath both types of soil appeared cobblestone at 6" DBS. Beside the cobblestone was found a medium brown soil with oyster bits. NO DENSE LAYER OF OYSTER WAS FOUND ABOVE THE COBBLE. In square B the initial layer was also a dark brown soil (1-3" DBS), followed by a yellow and beige sand lense. The next layer was a heavily disturbed fill (4-7" DBS). At 7" DBS the layer of flagstone was found. NO DENSE LAYER OF OYSTER WAS FOUND ABOVE THE FLAGSTONE. The other squares had similar stratigraphic sequences.

Squares Q,P,KK,W (most central):

These squares were the most central in the tavern yard. Square P began with a chocolate brown soil (1-6" DBS) followed by a layer of dense

oyster shell with brick (7" DBS). Cobblestone next appeared in the north wall of the square at 9" DBS. Beside the cobble was the medium brown soil with oyster bits. The next main layer was a medium brown fill which began at 16" DBS. The last layer was a red brown soil which became sterile at 24" DBS. Square Q also began with a layer of dark brown fill (1-5" DBS). The next main layer was a medium brown fill (6" DBS), followed by a layer of oyster shell with medium brown soil (8-16" DBS). This was interrupted by a yellow sand and red brown clay at 14" DBS. The next layer was medium brown fill (16" DBS). This soil gradually lost typical fill content and transitioned into red brown sterile soil at 24" DBS. The other squares had similar stratigraphic sequence. NOTE: square Q was intersected by a utility trench.

The area behind the smokehouse and storage house, near the present bank parking lot had a somewhat different sequence (Sqs. AA,BB,PP,SS,TT, WW). Two main features were located in this area, an extensive trash pit and a continuation of the cobble path. In trench TT where both the cobble and trash pit occurred the sequence was as follows: dark brown fill, medium brown oyster fill, cobble (17" DBS), medium brown fill (22" DBS), brick fragments and a dense oyster shell layer (27" DBS), red brown fill (33" DBS) to sterile. The soil or fill belonging to the trash pit began at 15" and continued past sterile soil. It was a dark brown with heavy coal, shell, and brick bits.

A test (square AAA) was made between squares R and UU to learn of the sequence beneath the mortar in those squares. Approximately 8" of mixed soils (sand, clay, loose dry soil) occurred beneath the mortar followed by red brown sterile at approximately 20" DBS.

\* It has been noted that in other areas of the Chesapeake, shell or fossilized shell (known as marl) was often used as a base for brick walkways.

The sequence being suggested by the groups of squares is as follows. The squares occurring at the very top and bottom of the slope with reference to the tavern yard only are the least complex and include no less than two and no more than four stratigraphic layers. As the squares approach the center of the yard, they become more complex (on a graph this would appear similar to a bell-shaped curve). Almost all the squares in the tavern yard began with a dark brown fill. At the highest point of the slope this fill was immediately followed by the 18th Century cobble at 6" DBS. In a somewhat central position, the dark brown fill was followed by a layer of oyster, then the cobble appeared. Sterile soil was encountered at a depth varying from 20 to 30" DBS throughout the site.

In agreement with the Orr's report of 1978, the original surface of the lots on which Reynolds built were irregular and hilly, and that this may have contributed to the irregularity found in the stratigraphic sequences of the site proper. By virtue of the orientation of the sequences, however, it can be suggested that late 19th Century and 20th Century disturbance (i.e. construction of the Farmer's Bank to the north, building of Franklin Street and parking lot to the south) was more likely a cause of the varying sequences of stratigraphy than not. Thus, the more complex sequence in the central yard area. Only a closer analysis of artifacts will support this statement.

#### Features

#### A. Structural Material

The first feature to surface was located in squares D and F, wight against the iron fence on Franklin Street near the SW corner of the tavern. At 6" DBS excavators uncovered a concrete slab, about 1 square foot, surrounded by part of a brick foundation, one course thick. Extending NW from this

, nwas?

slab was a 2' long semicircular brick wall (?) which may have been two courses thick. North of the slab was the remnants of a 2-course thick column in English bond. South of the semicircular brick wall and into adjacent square F surfaced a mix of cobblestone and flagstone, covering an area approximately 2' x 4'. If this feature belonged to a standing structure, it would have stood right next to the SW corner of the original tavern.

The function of the four structures remains unknown. Several descriptions have been advanced: 1) a structure corresponding to the staircase which, in the 18th Century, descended to the lower level entrance of Reynolds hat shop (see Orr, 1979); 2) a structure connected with or serving as a device to capture rain water from the roof of the tavern (South, 1982); 3) a structure involving fire due to charcoal remains on the concrete slab. A late 19th Century panoramic photograph was found in Train Done and Gone (1968) of this section of Annapolis. The photo had been taken from the State House facing west in 1880. A white cylindrical structure in the approximate place of Square D was noted. A relationship is yet to be confirmed.

#### B. 18th Century Cobblestone Path

Parts of the cobblestone path were located throughout the northern half of the tavern yard and behind the smokehouse and 20th Century storage house, near the present bank parking lot. It was in its most complete form in squares E,H,T,U approximately 30' N and 35' W of datum. These squares were right before the east entrance to the smokehouse. The original path was approximately 6' wide and had four linear rows of cobble, two in the center which probably served as a drain and one on either side used to establish its boundaries. Cobble was also located in squares P, NN, KK, GG, J, A, and QQ in the yard and trenches AA, BB, SS, TT and WW behind the smokehouse. A different kind of rock pavement (flagstone) was

located off the west wall of the 1906 addition of the tavern in squares B, EE, JJ, and MM. Whether this pavement was associated with the cobble path is still in question.

In trench TT a 2' square section of cobble was removed to determine the stratigraphy and artifact content beneath. All other cobbles and flagstones have been left in situ. Upon examination of the cobbles removed, it was determined that their long end was placed in the ground, with the short end on surface and receiving wear. First glance of these stones suggests that they were relatively small when, in fact, they were quite large. The short end of the cobble which surfaced usually appeared flat and smooth from wear. The cobbles were probably placed in an upright position for stability. All these stones were stream rounded cobble.

The cobble path probably ran west of the tavern and curved in a northerly direction as is suggested by the slight bend before and behind the smokehouse. It may have had some important function with Dean and /or West Streets. Whether it is contemporary with or predates the tavern is still in question. The smokehouse, however, sits right over the path; it has, therefore, been assumed that the cobble path predates the smokehouse.

## C. Trash Pit I

This trash pit was located in trenches AA and TT behind or off
the north wall of the smokehouse and 20th Century storage house. The
fill associated with the trash pit surfaced beneath cobble at approximately
17" DBS. Though the cobble did occur in AA, very few stones (5 to be exact)
were found. This may or may not have some association with the deposit
of the trash. The stratigraphy of trenches AA and TT suggest that the
pit had the form of a deep circular dish, narrowing towards the ground.
At 36" DBS the bottom of the pit had not yet been located. Elsewhere in
the trenches, at approximately 32" DBS sterile soil had been located.

Connu Crosky setor, it was suggested that Resed on the observation of the field director what appeared in trenches AA and TT is but a quadrant of the trash pit. The other portions were either under dirt or under the present bank parking lot. Much cultural material was found in the pit, most of which dated to the first and second quarter of the 18th Century.

#### D. Structural Debris

Oyster lime mortar (similar to that used to lay bricks in the 18th and 19th Centuries) and brick bats were found in an area encompassing 15 square feet in squares G, XX, X, CC, R, UU, and ZZ. This structural debris was 10° south of the cobble path and approximately 12" DBS. square G, after the removal of some brick bats and mortar chunks, the remaining mortar appeared uniform and flat, as it if served to floor some structure. Elsewhere the mortar appreared chunky and mixed with brick fragments. No other structural features, e.g. wood, brick, sills, postholes, nail concentrations, etc. were associated with this debris. A section of this mortar was removed (AAA) to determine the stratigraphy and artifact content beneath. It was suggested that the structural debris is later than the cobble path, but no other conclusive evidence was found.

#### Trash Pit II

The second trash pit was located in square A. Cobble was removed from square A later in the season to compare its stratigraphy with that in squares AA and TT. A white utility line was encountered during the removal of the cobble. This provided an explanation for the trench eviden above the cobble and provided support for the suggestion that the cobbles were not insitu and possibly not associated with those in front or the smokehouse. Further excavation revealed a dense layer of trash. This layer was 14-18" DBS and dense in materials dated to the third quarter of the 18th Century. The fill of this layer was mottled with charcoal and brick chips. Sterile soil was located in square A at 24" DBS.

#### F. Oval Well (?)

A sunken area of the Farmers Bank parking lot was broken by pick to remove the asphalt and see what was causing the depression. Beneath the asphalt, which was 3" thick, was a blackish green dirt, thick with asphalt bits and rubble. This layer was at least 8" thick. Beneath it was a gold-brown sand mix with oyster shell, brick bits and mortar. Bricks were surfacing at 14" DBS. A semicircular wall of brick was first defined at the southern and western side of the pit. At 24" DBS a sewer pipe was located on the east side. Cobble (large, fitted into the wall) was found in the north of the square. Few artifacts were removed, but what was removed dated to the first quarter of the 19th Century. This feature was 4'2" wide and approximately 7'4" long (oval).

## APPENDIX I

#### HIDIOKIC ANNAPOLID

## Reynold's Tavern Square Summaries 1982

Coordinate: N8W4

Square Letter: A

Date Opened: 6/7/82

Objective: To locate structural features and determine stratigraphic sequence.

## STRATIGRAPHY

Unit of Strat #	Depth	Description
4	Ground Cover	Consisted of a compound dirt with short grass; Diagnostic material: 1 1prlwr; 2 Buckley; 1 tin gl bl.
6	1-3"	Dark brown fill consisting of brick and oyster shell bits. In this unit, in the southern half of the square, was evidence of a narrow trench approx. 1' in width. This was the first feature on the site and was given U. of S. #41.
4 41	3"	Utility trench line consisting of very dark brown fill distinct from U. of S. #6. Diag mat: 3 prlwr; 1 crmwr; 1 rhen bl/gr; 3 rdwr ung1.
42		Interface from the utility trench #41.
10	3-6"	Gold brown clay soil located beside the trench and above $\#16$ .
16	6-11"	A group of semi-flat, rough cobblestone and a few pieces of fieldstone labeled feature No. 4.
15	6"	Medium bro soil between the cobblestone. Diag mat: 2 crmwr; 1 prlwr; 1 imp wh wr; 1 wsg.
121	7.5-11"	Medium brown fill consisting of brick and shell bits. Diag mat: 3 crmwr; 5 tin gl; 3 rdwr; 4 buff; 1 Buckley.
202	11-14"	Light brown soil with oyster shell bits. Diag mat: 3 sgraffito; 5 Buckley; 18 plain lead; 11 mottled & streaked; 13 tin gl undec; 11 tin gl bl; 17 undergl bl exp; 16 Eng brown; 3 WSG.
196	14-18"	Trash layer dense in materials labeled Feature No. 107. Diag. mat: 8 Buckley; 16 plain lead; 8 mottled & streaked; 7 tin gl undec; 8 ungl tin; 9 tin gl blue; 3 imp whwr; 4 Chinese por.; 3 Eng Brn.
197	14-18"	Interface from trash layer Feature No. 107.

#### Comments:

Evidence of the utility trench #41 (feature No. 1) disappeared at 6" DBS (down beneath surface) where the cobblestone appeared. Later in the season (7/27/82) cobble was removed in order to compare it and related stratigraphy to cobblestone located in front of the smokehouse in the tavern yard. A white utility line was encountered during the removal of the cobble. This provided an explanation for the trench evidence above the cobble and provided support for the suggestion that the cobbles were not insitu and possibly not associated with those in front of the smokehouse.

Further excavation revealed a dense layer of trash, probably associated with the tavern in the 3rd quarter of the 18th Century. The soils divide into 7 main units: dark brown fill; gold clay, cobble, med brown fill; lt brown fill; trash (feature); and sterile (red brown soil) which was located at 24" DBS.

Date Opened: 6/7/82

Objective: Locate structural features and determine stratigraphic sequence.

## STRATIGRAPHY

Unit of Strat #	<u>Depth</u>	Description
. 4	Ground Cover	Consisted of a compound dirt with short grass.
21–25	0-1 3/4"	Five types of decayed root holes, Feature Nos. 11-23.
20	3"	This unit was thought to be evidence of a soil change outlining a structure. It was identified as Feature No. 2. Evidence of the soil change disappeared almost immediately.
6	1-3"	Dark brown fill with shell and brick bits.
9	3-6"	Yellow brown sand lense.
11	3-6"	Beige sand lense.
71-73	6"	Three types of decayed root holes, Feature Nos. 23-26.
16 (36)	6"	Cobblestone was located in the northern half of the square. The cobble was roughly situated and included large pieces of fieldstone. Labeled Feature No. 4.
12	6-9"	Heavily disturbed brown soil.
66	7" .	White rubble in scatter labeled Feature No. 43.

## Comments:

The soils divide into 4 main units: a dark fill, sandy soil (probably attributable to later yard disturbance), cobble/fieldstone layer (insitu condition of which was questioned due to the heavily disturbed soil which followed. Square was not excavated to sterile soil.

## STRATIGRAPHY

Unit of	Strat # Depth	Description
2	Ground Cover	Consisted of a compound dirt with gravel.
7	1-12"	Medium brown fill with brick and oyster shell bits.
14	12-14"	Transitional brown soil with oyster shell.
26	14-16"	Dense layer of oyster shell labeled Feature No. 8.
17	16-18"	Medium brown fill with brick and oyster shell bits.
19	18-19"	Sterile soil (ochre-red brown and uniform).

Unit of Strat # Depth

Description

### Comments:

This square was only half excavated (western half) to sterile soil. On 7/28/82, the east half was excavated to 17-18" DBS. Prior to this date an auger hole was drilled in the west half of the square to note any changes in stratigraphy. No changes were found. The sequence of units in C was unlike that in A and B. For example, each unit was much deeper in C (probably due to the 15° slope of the yard). Although a dense layer of oyster shell was not found in Square A at the same depth, both Square A and B were more complex in stratigraphy than Square C.

The soil divides into 4 main units: med brown fill; oyster; med brown fill; and sterile soil.

Square Letter: E

Date Opened: June 7, 1982

Objective: To locate structural features and determine stratigraphic sequence.

Unit c	of Strat #	Depth	Description
4		Ground Cover	Consisted of a compound dirt with short grass. Diag mat: 11 crmwr (1 annular; 10 undec); 2 prlwr transfer; 1 underg1 blue exp.
34		1-6"	Chocolate brown soil. Diag mat: 133 crmwr; 48 prlwr (undec, shell edged, annular, transfer); 7 wsg; 7 English brn; 4 German Rhen bl/gr.
37		4"	Shallow sand lense squares, Feature Nos. 27-32. Probably the result of yardstones, either decorative or for walking.
38		4"	Decayed mortar mold labeled Feature No. 39.
39		411	Three decayed root holes of similar appearance. Feature Nos. 33,37,42.
40	· .	411	Six decayed root holes of similar appearance. Feature Nos. 34-36, 38, 40, 41.
35		7''	Dense layer of brick bats and oyster shell labeled Feature No. 9.
36	•	8-9"	Cobblestone layer.
58		8-11"	Medium brown soil with oyster shell bits beside the cobblestone. Diag mat: 1 tin gl undec; 1 crmwr; 3 undergl bl exp; 2 rosso antico.

The cobblestone located at 8-9" DBS was laid for walking or riding use. The portion of the path which was visible in this square was the southern half of its 6' width. Two linear rows of cobble were located in the center of the 6' wide path. A single linear row of cobble was found as a southern barrier for the path. The direction of the path was approximately East-West. Cobbles in the linear rows were placed with their longer sides parallel with the ground. Those cobbles within the barriers were placed with their longer side perpindicular to the ground. These latter cobbles exhibit definite wear patterns (appear flat) on their surfaces. The layer of brick bats and oyster shell may have served as a special fill (?). Such a layer occurred only above the cobble.

The soils divide into four main units: chocolate brown soil; layer of brick bats and oyster shell; cobblestone; medium brown soil with oyster shell bits. The cobblestone was found a little deeper than that in squares A or B.

Objective: To follow features uncovered in Square D and determine strati-

graphic sequence.

Unit of Strat #	Depth	Description
4	Ground Cover	Consisted of a compact dirt with short grass.
8	1-3"	Chocolate brown fill with brick bits.
27	3-6"	Yellow brown soil.
29	6"	Cobblestone and fieldstone associated with that in Square D. Feature No. 5.
13	6-11"	Red brown soil.
18	11"-	Ochre brown soil which became steril@ at 24" DBS.

Description

#### Comments:

The cobblestone and fieldstone (Feature No. 5) was associated with the structural features found in adjacent square D (Strat #'s 28, 29, 31, 33). As stated in the comments in square D, the function of the 4 features remains unknown. The red brown soil transitioned into an ochre brown soil not reached in square D at 11". This ochre brown soil became sterile at 24" DBS. As with square D, square F was located right against a 12" cement wall which serves as a base for the iron fence separating the tavern yard from the cement sidewalk on Franklin St. It is hard to determine whether or not the structural evidence in squares D or F was restricted to the area created by the fence line or whether the construction of the fence and/or sidewalk disturbed the features substantially. The soil divided into four main units: chocolate brown fill; yellow brown soil; cobblestone/fieldstone; and red brown soil which became sterile at 24" DBS.

# Reynold's Tavern Square Summaries 1982

Coordinate: N2W9

Square Letter: G

Date Opened: 6/9/82

Objective: To locate structural features and determine stratigraphic sequence.

Unit of Strat #	<u>Depth</u>	Description
2	Ground Cover	Consisted of a compact dirt with gravel.
43	1-7"	Dark brown fill.
164	3"	18" wide utility trench (20th Century electrical).
42	3"	Interface from utility trench (No Feature Nos. assigned).
10	3-6"	Gold brown clay fill of the utility trench.
82	6-13"	Red brown soil with red brick, coal, and shell bits.
101	11.5-13"	Chunky oyster lime mortar mixed with a few brick bits in the NE corner of the square.
107	15"	Large decayed root holes (not given Feature Nos.).
117	21-24"	Red brown soil minus brick and shell fragments.
119	23"	Dark brown stain labeled Feature No. 10.

The utility trench remained unexcavated for the duration of the field season. The mortar surface which was encountered at 11.5" DBS was probably the result of nearby construction (19th Century?). It was an oyster-lime mortar similar to that used to lay brick in the 18th and 19th Centuries. The mortar may have served as part of a structure; in what capacity, however, is unknown. No other structural features e.g. wood, brick, post holes, sills, nail concentrations etc. were associated with the mortar. Squares XX, X, R, CC, UU, and ZZ were excavated to follow the mortar and determine its function. No conclusive evidence was found. The mortar was left unexcavated and the remaining portion of the square was excavated, only to encounter a red brown soil which was relatively sterile. An auger hole was later driven to confirm sterility. The soil divided into three main units: dark brown fill; red brown fill w/ brick & shell; red brown, uniform soil.

48		Smokehouse wall against trench.
79	5"	Decayed root hole Feature No. 72.
13	6-11"	Red brown soil. Diag mat: 23 prlwr; 42 crmwr; 7 rd body (5 plain) 1 mottled/streaked; 1 tin gl blue; 1 WSG molded.
35	7"	Brick and oyster shell layer Feature No. 9.
36	8-9"	Cobblestone beneath brick and oyster shell layer.
104	10"	Yellow brown sand. Diag mat: 1 undergl bl. exp.
60	17"	Light sand mix at base of builder's trench.

The materials found in the builder's trench (#46) suggest a date range from the late 18th Century to the early 19th Century. This suggests that the smoke-house postdates the building of the tavern. The cobblestone located at 8-9" DBS was associated with that in square E. It covered the NE corner of the square, suggesting a northernly bend towards the smokehouse. Again, there was a single linear row of cobble serving as a southern boundary with the long side parallel to the ground, while the remaining cobble was placed perpindicular to the ground.

The soils divided into 4 main units (excluding builder's trench): yellow-brown sand lense (probably the result of 20th Century disturbance. Sand "squares" were found throughout this section of the yard); red brown soil; layer of brick bats and oyster; and the cobble. U. of S. #'s 104 and 60 were within the trench. The square was not excavated to sterile soil.

Coordinate: N9W5

Square Letter: J

Date Opened: 6/10/82

Objective: To locate structural features and determine stratigraphic sequence.

Unit of Strat	# Depth	Description
4,5	Ground Cover	Consisted of a compound dirt with short grass. Concrete was at the north end of the square. It serves as a gutter and base for the fence line separating the Tavern yard from the Farmer's bank to the north. The concrete determined the 5' x 2.5' size of the square.
43	1-8"	Dark brown fill with brick and oyster bits. Diag mat: 4 prlwr; 3 crmwr; 3 rd body (2 ungl); 1 Buckley; 1 crouchwr; 1 Rhen bl/gr.
96,97	411	Decayed root holes labeled Feature Nos. 87 and 88.
36	8-9"	Cobble.

Unit of Strat # Depth

Description

#### Comments:

This square was difficult to excavate due to the large Magnolia tree roots which penetrated the ground at all angles. Cobble, however, was located at the same depth as that in squares E and H. Due to eruption caused by the tree roots, the cobblestones were not insitu. No brick and oyster shell layer was found above the cobble and material concentration was much less than in squares H and E. During excavation the utility line which was found in square A was also located. The line bends around the Magnolia tree and moves towards the smokehouse.

The soil divides into 2 main units: dark brown fill and cobblestone. The square was not excavated to sterile soil.

Reynold's Tavern Square Summaries 1982

Coordinate: N9W3

Square Letter: K

Date Opened: 6/10/82

Objective: To locate structural features and determine stratigraphy.

Unit of Strat #	Depth	Description
4,5	Ground Cover	Consisted of a compact dirt with short grass.  Concrete at north end serves as a gutter and base for fence line separating Tavern yard from Farmer's Bank.
6	1-3"	Dark brown fill with brick and oyster bits.
75	3-4"	Red brown soil.
76	3-4"	Uniform dark brown soil.
77		Decayed root hole Feature No. 71.
103	9"	Gray soil associated with cement extension supporting fence line.
104	10"	Yellow brown sand.
36	11"	Cobblestone.
144	14"	Red brown clay with little brick.

The soils in this square appear complex. This is in part due to the construction of the concrete base. Cobble was also located in this square and is probably associated with that in squares E, H, and J. J and K differ in stratigraphy for two reasons 1) K had substantially less disturbance from tree roots; 2) It was excavated to a greater depth.

The soils divided into 5 main units: dark brown fill; dark (red) uniform soil; yellow brown sand; cobblestone; and red brown clay. The square was not excavated to sterile soil.

 $\label{eq:Decomposition} \textbf{Objective:} \quad \textbf{To locate further evidence of the features in square D and determine}$ 

stratigraphic sequence.

<u>Ur</u>	it of Strat #	Depth	Description
•.	4	Ground Cover	Consisted of a compact dirt with short grass.
	50	1-8"	Yellow-brown sandy layer.
	51	8-12"	Red brown soil
	155	12.5"	Decayed root hole (not given Feature No.)

This square was excavated in an attempt to locate further evidence of the features in square D. No evidence was encountered. The stratigraphic sequence was relatively simple. The red-brown soil (51) was not excavated to sterile soil. Though not given a unit number, there was a brief layer of oyster shell between units 50 and 51 in the east wall only.

Cobble did surface at 8-9" DBS, but in the very north end of the square. Again, a dense layer of brick bats and oyster shell occurred above the cobble (see squares E and H). The remaining portion of the square was excavated to learn the stratigraphic sequence beside and beneath the cobblestone. Six main units composed the square: chocolate brown soil; brick and oyster shell layer; cobblestone; medium brown soil between the cobblestones; medium brown fill; and red brown soil which became sterile c. 24" DBS.

# Reynold's Tavern Square Summaries 1982

Coordinate: N5W6

Square Letter: Q

Date Opened: 6/11/82

Objective: To locate structural features and determine stratigraphic sequence.

<pre>Unit of Strat #</pre>	Depth	Description
		•
4	Ground Cover	Consisted of a compact dirt with short grass.
164	3"	Utility trench
10	3"	Gold brown clay within utility trench.
42	3''	Interface from utility trench.
43	1-7"	Dark brown fill beside utility trench
78	6"	Medium brown fill with shell and brick fragments.
153	6", 14"	Mortar lines in North profile.
106	8-16"	Oyster shell with medium brown soil.
108	14"	Yellow brown sandy soil.
109	14"	Medium brown sandy soil mixed with mortar.
113	16"	Red brown clay with charcoal.
116	16"	Decayed root holes Feature Nos. 90-92.
120	16.5"	Red brown decayed root holes Feature Nos. 94, 95.
112	17"	Medium brown general fill.
133	20.5"	Medium brown soil with no shell, slight brick bits.
139	24"	Red brown clay.

Reynold's Tavern Square Summaries 1982

Coordinate: N4W7

Square Letter: R

Date Opened: 6/11/82

Objective: To locate structural features and determine stratigraphic sequence.

Unit of Strat #	Depth	Description
3,1	Ground Cover	Consisted of a brick walk set in sand.
164	3"	20th Century utility trench in SE corner (associated with that in square G and Q).
42	3"	Interface from utility trench.
10	3"	Gold brown clay fill of trench.
59	4.25"	Decayed root holes Feature Nos. 57-59.
43	1-7"	Dark brown fill.
68	6.5-7"	Decayed root holes Feature Nos. 66,67.
63	7.5-8"	Oyster shell layer with medium brown soil.
82	6-13"	Red brown soil with red brick, coal, and shell bits.
74	9 3/4"	Decayed root hole Feature No. 70.
101	11.5-13"	Mortar (oyster lime) surface.
167	12-14"	Light brown sand (square AAA)
168	14-15"	Gold Clay (square AAA).
169	15-18"	Medium brown loose soil (square AAA).
170	18-23"	Red brown sterile soil (square AAA).

The utility trench was the same as that found in squares G and later R. The width of the trench (18") was determined in this square. Once sterile soil was reached c. 24" DBS, an auger was taken to note any significant changes in stratigraphy. None were detected. There were five main fills intermixed with oyster shell and sandy soils. The complexity of this square was probably the result of the construction of the utility trench, combined with its central location in the yard. The trench began at the NW corner of the 1906 addition of the Tavern and headed directly SW towards a utility pole on Franklin St.

The main units were as follows: Dark brown fill; medium brown fill; red brown clay; medium brown fill; medium brown, uniform soil and red brown, sterile clay.

		_plan		
	2	_profile	Historic	Annapolis Form
	·	_plan		

The same utility trench found in squares G and Q was found in square R. As in square G, mortar appeared c. 11-13" DBS, possibly the result of construction (19th? Century). It was an oyster lime mortar similar to that used to lay bricks in the 18th and 19th Centuries. The mortar may have served as part of a structure; in what capacity, however, is unknown. No other structural features e.g. wood, brick, post holes, sills, nail concentrations, etc., were associated with the mortar. Squares XX, X, CC, UU, and ZZ were excavated to follow the mortar and determine its function. No conclusive evidence was found. On July 20 it was decided to open a 2.5' x 2.5' square between square R and adjacent square UU to date material and learn stratigraphy beneath the mortar. Before reaching sterile soil four different lenses/layers were identified (See U. S. #'s 167-170). Among materials found beneath the mortar was WSG and Chinese export porcelain. The stratigraphy from the surface to sterile at 24" DBS was relatively complex. There were three main units above the mortar: dark brn fill; oyster & dirt; red brn fill) and a sand and clay mix beneath the mortar. The latter may represent disturbance created when the mortar first fell to the surface.

Reynold's Tavern Square Summaries 1982

Coordinate: Not on grid (within smokehouse)

Square Letter: S

Date Opened: June 14, 1982

Objective: To learn the construction of the smokehouse floor, determine other,

if any, functions of the smokehouse, and locate diagnostic materials

which will help date the smokehouse.

### **STRATIGRAPHY**

Unit of Strat #	Depth	Description
53	Cover	Brick floor of smokehouse (floor 1).
54	1.5"	Mortar fill beneath brick floor 1.
55	2"	Ash layer beneath brick floor 1.
56	2-4"	Second brick floor.
64, 70	8"	Ash rubble layer Feature No. 69.
175	13-17"	Ash layer beneath rubble layer.
177	17"	Mortar interface before 3rd brick layer.
176		Mortar interface beneath 3rd brick layer.

### Comments:

The brick in the floor throughout was laid in English bond. The ash was probably the result of fire activity, however, no faunal material was found. No material items were found between the floors.

## Reynold's Tavern Square Summaries 1982

Coordinate: N8W9

Square Letter: T

Date Opened: 6/17/82

Objective: Unearth more of the cobble path and locate a builder's trench associated with the construction of the smokehouse.

### STRATIGRAPHY

•		SIRALIGRAPHY
Unit of Strat #	Depth	Description
4	Ground Cover	Consisted of a compact dirt with short grass.
5	1-3"	Yellow sand lense squares, probably the result of yard stones used in the 20th Century.
83	1–5''	Medium brown fill. Diag mat: 131 crmwr; 13 prlwr; 5 plain lead rd bdy; 3 English brn; 1 WSG; 1 Crouchwr; 1 Scratch bl; 1 Rhen bl/gr; 6 tin gl undec.
87	1-5"	Chocolate brown fill.
130	2-9"	Medium brown fill (east wall).
9	3-6"	Yellow brown sand lense. Diag mat: 1 transfer prlwr.
85	5''	Builder's trench against smokehouse doorway Feature No. 85.
214	5"	General contents from builder's trench. Diag mat, (stated to be from 85): 12 crmwr; 1 prlwr; 2 porc; 1 rd bdy plain.
213	5"	Interface from builder's trench.
86 (41)	5"	Utility trench Feature No. 1.
42	5"	Interface from utility trench.
94	5–9"	Gold brown clay within utility trench. Diag mat: 3 crmwr; 4 prlwr; 1 ww; 3 rd bdy plain; 1 rhen bl/gr.
13	6-11"	Red brown soil.
35	7"	Brick and oyster shell layer Feature No. 9.
36	8-9"	Cobblestone beneath brick and oyster shell layer.
118	9.5"	Oyster shell with medium brown soil beside cobblestone. Diag mat: 5 crmwr; 1 prlwr.
162	13,"	Medium brown fill near smokehouse door.

#### Comments:

Three features were found in this square, a builder's trench associated with the renovation of the smokehouse doorway (85), a trench belonging to the 20th Century utility line first located in square A (Feature No. 1), and the cobblestone path (36). The builder's trench was first excavated, then the remaining portion of the square excluding the utility line. The cobblestone path was part of that located in squares E and H. It covered 3/4 of this square. A single linear row of cobble served as a northern boundary with the long side parallel to the ground, while the remaining cobble was placed perpindicular to the ground. The utility trench was finally removed to unearth the remaining cobble. Beneath the surface and above the utility line was piled cement rubble, a deliberate protective layer for the utility line. There were three main fills above the cobble intermixed with a sand lense and disturbed soils from the two trenches.
